Wondering why it's worth hiring me to work together?

- Very good scientific background and track record in developing “biodegradable” high-performance polymers 100% from renewable resources with promising potential applications.
- Original/innovative **three proposals** (a **detailed research programme for the next 3-4 years**) on **integrating fully renewable Furan-based packaging materials in the circular bio-economy¹** (ready for implementation), which could certainly be successful projects of establishing a new independent research line in your facilities that would lead to excellent outputs.
- Deep knowledge of Design, Synthesis and study of next-generation Green Bioplastics, mainly Co/polyesters-type from biobased monomers with a special focus on **2,5-furandicarboxylic acid**-based ones.
- Excellent network with renowned European scientists and experts working in this interesting research field.

outputs

1

- Writing excellent collaborative research proposals to successfully obtain grants from national and/or European funding agencies

2

- Attract highly talented and motivated students and postdocs who are interested in working on the development and chemical recycling of sustainable polymers

3

- Expand your research activities at your institution in an exemplary manner
